Fellow Oklahomans:

One of Oklahoma's most important industries continues to be agriculture. It's influence is felt throughout all seventy-seven of the State's counties and has it's major impact in most rural communities. However, the importance of food and agriculture is also significantly felt in the State's cities. Fully two-thirds of Oklahoma farmers work off the farm in other jobs. In addition, wives and other family members working off the farm provide supplemental income. All of this points to how interwoven life in Oklahoma is between urban and rural elements. The interdependency between urban and rural populations builds a strong sense of value that each has for the other. This mutual respect and appreciation is reflected in the pride that citizens of this State have for Oklahoma.

This statistical measure of the State's Agricultural is made possible by farmers and ranchers who have supplied survey data on their individual operations, as well as data received from grain elevators, slaughter plants and other agribusinesses. I offer my sincere thanks to each one who voluntarily supplied information and helped insure the accuracy of these data.

Sincerely,

Jack D. Craig

Jack D. Craig
President

Presented in this report are measures of Oklahoma's agricultural production. These agricultural statistics are based on survey responses from farmers, ranchers and agri-businesses. We wish to express our appreciation to all of the respondents who voluntarily participated in the sample survey.

The office staff who prepared these agricultural statistics are John Waldrop, Assistant State Statistician, with Agricultural Statisticians Burton Bartlett, Daryl Brinkman, Riley Henderson, Monnie Miller, Dave Ranek, and Ramona Taylor. The program support group includes Sharon Adams, Juanita Davis, Charlotte Gamble, Diana Johnson, Beverly Masquat, Patricia McClain, Nancy Parsons, Alberta Penix, Donna Scott, Kathy Sherfield, Ila Mae Spiva, Marilyn Vreeland, and Joanne Weece.

This publication was assembled under the guidance of Burton Bartlett with assistance from support personnel.

Current reports and forecasts may be obtained by writing the Commissioner of Agriculture or the State Statistician.

Sincerely,

John Cochrane

John E. Cochrane
State Statistician

OKLAHOMA CROP AND LIVESTOCK REPORTING SERVICE

SAMPLING METHODS AND ESTIMATION

The data collection program of the Crop and Livestock Reporting Service consists of surveys designed to produce current agricultural statistics of acreages, yield and production of crops, livestock and poultry inventories, and other information pertaining to Oklahoma's agricultural economy.

The most important source of survey data is the farm operator who voluntarily supplies information about his farming operations. Most surveys include a fairly large sample of operators which are surveyed by mail. Some producers may be in a smaller pre-selected probability sample in which responses are collected by personal interview or by telephone.

Data are also collected from agribusiness firms and merchants serving agriculture. Both suppliers of agricultural inputs and purchasers of raw farm outputs are important sources for developing statistics on agricultural commodities. In addition, these firms can also provide valuable data on quantities marketed or processed, which are used as check data to revise earlier estimates made from sample surveys. Data from these sources are especially useful in the nonprobability mail surveys.

Survey methods have changed significantly during the past two decades and many different sampling and surveying techniques are used currently. Lists of farm operators, including names and addresses, are used for many of the surveys and are well suited for the collection of information by mail. The low cost of data collection from a list sample is one of the principal advantages of this method. Another advantage is the ease with which supplementary information can be included and used to classify operations as to type and size. This allows the use of efficient stratified sample designs.

Today, many probability surveys, using personal interviews and actual field counts to collect data, supplement the mail approach. Enumerative surveys require the collection of survey data pertaining to specific land areas (segments). In Oklahoma, a sample of 360 segments which average approximately one square mile in size are enumerated each year. The information collected is used to supplement mail surveys to provide indications on crop acreages and livestock numbers. Objective counts and measurements are taken each month throughout the growing season from 200 randomly selected wheat yield plots. This information is used to supplement indications of wheat yield provided by the mail responses from monthly crop reporters. The enumerative and objective yield field activities are conducted by approximately 40 part-time enumerators whose work helps provide information for preparing more reliable statistics.

The Oklahoma Crop and Livestock Reporting Service also participates in a research project called AGRISTARS. The primary objective of this project is to make use of satellite information to improve the precision of crop estimates at the state, crop reporting district and county levels. Another goal is to develop methods which will give early warning to the agriculture industry of changes in crop conditions that may affect production. The project is a cooperative effort of the U. S. Departments of Agriculture, Commerce and Interior, NASA, and the Agency for International Development.

John Waldrop,
Assistant State Statistician

U.S. CENSUS OF AGRICULTURE - OKLAHOMA FARM DATA IN BRIEF

ITEM		1974 1/	1978	1982
		Land Utilization		
Total Land Area	Acres	44,020,800	44,021,760	43,939,270
Land in Farms	Acres	33,082,848	33,737,292	32,369,206

1984 CROP WEATHER REVIEW

January: Mild weather during late month brought wheat out of dormancy. Many growers began fertilizer applications and weed control measures. Only light insect activity was observed throughout the State. Cold weather early in the month limited cattle gains and created a heavy demand for hay. Warm weather later in the month, however, reduced the need for supplemental feeding.

February: Warm weather and adequate soil moisture enhanced wheat development across Oklahoma. Above normal temperatures, good soil moisture and fertilizer applications stimulated small grain growth. No serious insect activity was observed, but weeds plagued many fields. Wheat pasture made limited growth. Cattle on grass pasture required supplemental feeding.

March: Cool, wet weather slowed growth and development of small grains as well as limiting topdressing and weed control activities. Only 25 percent of wheat was in jointing stage at month's end, compared with 35 percent average. Wet weather also delayed row crop seedbed preparation and planting. Soil moisture, which was short in 15 percent of the counties on March 1, was adequate-to-surplus in over 95 percent of the counties by the month's end.

April: Below average temperatures prevailed during the month. Cool, cloudy weather restrained growth of wheat and other small grains. Weed infestations and soil borne mosaic disease were of particular concern to North Central producers. Row crop activity also lagged behind normal as a result of the unfavorable weather.

May: Mild weather supported wheat growth and development in northern areas of Oklahoma; however, prolonged dry weather prevailed in other parts of the State. Armyworm infestations in northern localities required control measures. Disease and weed problems also threatened small grain crops in northern areas. Most row crop plantings, which were behind normal at the beginning of May, were on pace with the 5-year level by the end of the month. Cotton producers delayed planting activities awaiting better soil moisture conditions.

June: Favorable weather supported wheat harvest across Oklahoma. Nearly 90 percent of the crop was harvested by July 1, compared with 80 percent average. Yields and test weights were reported higher than expectations in most western localities. Weeds in uncut fields presented problems to many growers in the northwestern third of the State. Some southwestern cotton producers were "dusting in" seed as soil moisture conditions continued dry.

July: Very little moisture was received during the month, resulting in moderate-to-severe row crop stress. Cotton received the brunt of the hot, dry weather and fields with extremely poor stands were plowed under. Cotton growers planted sorghum as late as mid-month as an alternative crop. Growth, especially of late-planted crops, was limited as soil moisture was lacking. Pastures also deteriorated because of extreme moisture shortage.

__August__: Hot, dry weather resulted in crop stress for all dryland row crops. Prolonged dryness delayed wheat seedbed preparation. Panhandle sorghum was severely stressed and soybeans in the southeast were dropping blooms. Poor grazing conditions and low pond levels in some areas necessitated supplemental feeding and hauling of water. Topsoil moisture was short in nearly all of Oklahoma's counties, while subsoil moisture was short in nearly 90 percent of the counties.

__September__: Dry weather thwarted wheat seeding, particularly in the western half of the State and diminished row crop production prospects. Herd liquidations began because of dwindling pasture, hay, and water supplies. Many farmers "dusted in" wheat seed in hopes of obtaining pasture. Only 20 percent of the total wheat crop was seeded by October 1, compared to the 5-year average of 40 percent.

__October__: Rains during early autumn aided small grains but delayed row crop harvest. Frost during the last week of the month lowered grain sorghum moisture content but damage to cotton was light. Good moisture aided winter grass growth, but forage supplies were still short in all crop reporting districts.

__November__: Dry weather retarded growth of small grain crops. Rain during the last week of the month, however, benefited dry areas of western Oklahoma, particularly wheat that was "dusted in." Weeds were a severe problem in parts of North Central Oklahoma and some control measures were initiated to combat their growth. High moisture content kept most row crops from being harvested.

__December__: Plentiful rainfall and above normal temperatures improved wheat conditions. Some low-lying fields were under water from excessive rain. Cheat sprouted along with "dusted in" wheat in parts of the North Central district. Supplemental feeding was heavy in parts of western Oklahoma. Hay supplies were tight and prices were high.

1984 CROP PRODUCTION

Crop production increased substantially as more acres were harvested and yields were better. Temperatures and soil moisture were generally favorable for small grain development during most of the Spring. Unfavorable April weather slowed row crop plantings until May. Hot, dry conditions from June through September stressed row and hay crops. Early October rains, while beneficial to small grain crops, delayed row crop harvest. In contrast, a dry November limited small grain growth but aided row crop harvest which was near completion by the month's end.

The 1984 wheat crop, at 191 million bushels, was the fourth largest recorded, exceeded by 1979, 1980, and 1982 crops. It resulted from the second highest yield of record, 36 bushels, and 5.3 million acres harvested. Acreage harvested was 23 percent greater than the previous year and accounted for 69 percent of the 7.7 million acres seeded.

Planted acreages were larger for all crops except wheat and soybeans. Corn for silage and soybeans were the only crops with less harvested acreage. Other noteworthy changes in harvested acreage were sharp increases in grain sorghum and cotton after two consecutive years of decline.

Cotton yielded an average of 234 pounds per acre; grain sorghum, 40 bushels per acre; soybeans, 19 bushels per acre; and corn, 105 bushels per acre. Hot, dry weather during the critical pollination stage contributed to lower corn yields.

Peanut production totaled 189 million pounds from 91,000 acres. Abandonment was higher than normal as cool, wet conditions in southeastern counties rotted peanuts in the ground as well as some after being dug.

Summer drought conditions reduced native grass hay yields. Alfalfa hay yields; however, equalled the previous year. Acreage harvested was unchanged and the net result was a decline of 4 percent in total production. Hay carryover stocks were 16 percent greater than the previous year as the winter was milder than expected.

Pecan production totaled 24 million pounds and peach output amounted to 9 million pounds.

OKLAHOMA LIVESTOCK - JANUARY 1, 1985

Oklahoma's cattle and calf inventory on January 1, 1985, decreased moderately from a year earlier. Annual average prices received in 1984 for all livestock species except sheep and lambs decreased from 1983.

Cattle and calves on Oklahoma farms and ranches totaled 5,300,000 head on January 1, 1985, down 4 percent from the previous year. The State's cow inventory totaled 2,100,000 head and was composed of 1,993,000 beef cows and 107,000 milk cows, down 5 and 3 percent respectively from a year earlier. The number of calves under 500 pounds was down from January 1, 1984. The average inventory value of $325 per head gave a total dollar value for all cattle and calves on the State's 66,000 cattle operations of $1.7 billion, 3 percent above the value a year earlier.

The number of cattle and calves in Oklahoma feedlots on January 1, 1985, was 30 percent above the previous year and 3 percent below the all time high number on January 1, 1978. Fed cattle marketings during 1984 were 9 percent above a year earlier, but 17 percent below the record number marketed in 1978. Cattle and calves placed on feed during the year were up 25 percent from 1983.

Hog numbers as of December 1, 1984 totaled 220,000 head on the State's 6,000 hog operations. Total hog inventory was down 24 percent, breeding stock was unchanged while the number of market hogs was down 26 percent from December 1, 1983. The 1984 pig crop was 17 percent less than a year earlier and included 133,000 spring pigs and 130,000 fall pigs. Average value per head of $65.00 resulted in a total inventory value of $14.3 million.

Sheep and lamb inventory declined for the second consecutive year. Sheep and lambs on Oklahoma's 2,500 sheep farms on January 1, 1985, decreased 13 percent from a year earlier and included 65,000 stock sheep and 20,000 sheep and lambs on feed. The 1984 lamb crop of 60,000 head was 8 percent below the previous year. Wool produced during 1984 totaled 653,000 pounds, 24 percent less than the previous year's production. The average value per head of $65.50 was above January 1, 1984, but the decrease in inventory resulted in a 15 percent decrease in total value for all sheep and lambs.

Inventory, Supply and Disposition: Balance Sheet estimates; the sum of inventory on hand beginning of year, births and inshipments equals the sum of marketings, farm slaughter, deaths and inventory on hand end of year.

Prices: State prices are as published in the February Agricultural Prices report, and are computed by weighting monthly estimated prices received by farmers, by monthly quantities sold.

Marketings: Includes animals for slaughter market, as well as younger animals shipped to other states for feeding or breeding purposes. Excludes interfarm sales within the state and farm slaughter. Number of head marketed includes all custom slaughter but liveweight marketings shown in pounds exclude custom slaughter consumed on farms where produced.

Farm Slaughter: Animals slaughtered on farms primarily for home consumption. Excludes custom slaughter for farmers at commercial establishments.

1984 DAIRY REVIEW

The average number of milk cows in Oklahoma declined by 3 percent in 1984. Average production per cow decreased to 10,561, while total production at 1.1 million pounds was down 4 percent from 1983. Total cash sales dropped to $153 million compared to $163 million a year earlier.

The average number of milk cows on the State's farms during 1984 was 107,000 head, 3,000 head below 1983. The average annual output per cow was 10,561 pounds, down 194 pounds (2 percent) from the previous year. The number of farms with milk cows totaled 6,000 in 1984, the same as in 1983.

Oklahoma's dairymen marketed 1.1 million pounds of milk and cream during 1984, 5 percent below 1983 marketings. These marketings accounted for 97 percent of the State's milk production. The remaining production was used for household purposes and fed to calves on farms where produced.

The quantity of whole milk (net whole milk equivalent) utilized in manufacturing dairy products totaled 441.0 million pounds in 1984, compared with 496.0 million pounds in 1983.

Production of creamed cottage cheese, at 10.0 million pounds, showed a slight decrease of 1 percent from a year earlier. Both cottage cheese curd and lowfat cottage cheese increased in 1983.

Total production of frozen dairy products increased 7 percent from 1983 to 16.0 million gallons. Ice cream production totaled 1.1 million gallons an increase of 12 percent from 1983. The output of ice milk decreased 2 percent, while milk sherbet increased 12 percent. Mellorine production decreased 17 percent to the lowest level since records began in 1952.

POULTRY REVIEW - 1984

There were 5.0 million chickens (excluding commercial broilers) on Oklahoma's farms and ranches as of December 1, 1984, 6 percent above the inventory of a year earlier. The State's laying flocks totaled 3.7 million hens and pullets, as of December 1, which accounted for 74 percent of the total. Egg production for the year ending November 30, 1984, was 879 million, up 5 percent from a year earlier. Cash receipts for eggs during 1984 were $59.6 million, up 17 percent from the previous year. Oklahoma's egg producers earned an additional $1.9 million from the sale of culled layers during 1984.

Oklahoma's egg output is concentrated in the Central and Eastern parts of the State. A major portion of the State's commercial layers was raised in Adair county, which has been the State's leader in total layer numbers for the past nine years.

Riley G. Henderson
Agricultural Statistician

FARM PRICE REVIEW

The Prices Received Index for all crops in 1984 averaged 140 percent of 1977 = 100 base. Winter wheat averaged $3.35 per bushel in 1984, down 16 cents from 1983's figure. Cotton lint prices decreased 16 percent from 1983 to 48.7 cents per pound, while cottonseed averaged $103.00 per ton, down 43 percent. Season average prices of other crops, and the changes from 1983 were: grain sorghum, $4.50 per cwt., down 63 cents; oats, $1.90, up 5 cents; corn, $3.10 down 50 cents; barley, $2.40, down 10 cents; rye, $3.00 up 50 cents; soybeans, $5.65 down $1.95. Peanuts were up 1.0 cent to 27.0 cents per pound and pecans increased slightly to 48.8 cents per pound. Alfalfa hay prices ranged from $120.00 per ton in December to a low of $70.00 in May.

Livestock prices were generally down in 1984 with cattle accounting for most of the decreases. The Index of Livestock and Livestock Products averaged 149 percent of 1977 = 100 base year. All Beef Cattle dropped for the fifth consecutive year, down 1 percent to $51.00 per cwt. Steers and heifers were up $1.20 per cwt., while cows were off 90 cents. Calves under 500 pounds brought $1.90 per cwt. less in 1984. Dairy cow replacements cost $170.00 less per head, averaging $860. Prices received for milk averaged $13.80 per cwt., down 20 cents from 1983. Hog prices were off in 1984, averaging $45.00 for the year.

Cash receipts from farm marketings totaled $2.6 billion in 1984, a 1 percent increase from 1983. Cash receipts from sales of crops fell $63 million. Livestock and related products increased $86 million and accounted for 69 percent of total farm receipts.

Oklahoma farm real estate values remained the same for 1984. The State average value for farmland and buildings amounted to $699 per acre.

1/ Revised. Details may not add to totals due to rounding.

All income derived from farm operations and Government farm programs is included in the above table. The following description of terms may be helpful in interpreting the table:

Cash Receipts from Farm Marketings - Receipts from sales, loans made or guaranteed by CCC and purchases under price support programs.

Government Payments - Those payments made to farmers in connection with programs such as Agricultural Conservation, Feed Grain, Wheat and Cotton, Disaster Payments, etc.

Non-Money Income - Includes the value of farm products consumed directly in farm households and the rental value of housing provided by farm dwellings. Expenses are included in the production expense estimates, thus non-money imputations do not add on a dollar-for-dollar basis.

Realized Gross Farm Income - The sum of the above income sources.

Farm Production Expenses - Cost of current operations (excludes new capital equipment, taxes, and rents).

Realized Net Farm Income - Realized gross income minus production expenses.

Net Change in Farm Inventories - Value of change in quantities of crops and livestock products kept on farms from one year to the next (may be a minus value).

Total Net Farm Income - Realized net income plus the net change in inventories.

FOREIGN ACTICULTURAL TRADE

Basis for State Estimates

U.S.D.A.'s Economic Research Service (ERS) publishes estimates of U.S. Agricultural Export contributions by States on a fiscal year basis. These estimates by State for major commodity groups were based on the assumption that State contributions to exports are equal to each State's share of production or marketings.

Farm marketing ratios from the census of agriculture or other sources were used to calculate State shares where production statistics by State were not available. State export estimates for wheat were calculated based on export inspections for major types, including hard red winter, spring, and durum. Census Bureau export data groups all wheat types into a single commodity. Wheat export inspections from different port areas yielded information on hard winter, hard spring, soft winter, and durum. Estimates of feeding and ending stocks for feed grains were used along with production by State.

The share-of-production method was used to compute export shares for cotton, cottonseed, soybeans and products, peanuts, and rice. For some commodities, production was not readily available. Exports of beef, animal fats, and cattle hides were estimated using commercial cattle slaughter data for 1983.

AGRICULTURAL EXPORTS: OKLAHOMA AND THE U.S., 1983-1984 1/

LIST OF AVAILABLE REPORTS

The Oklahoma Crop and Livestock Reporting Service publishes official estimates of crop and livestock production, prices received and paid by farmers, and various other special reports. The reports containing such data and the approximate date of release are shown below. These reports are free to producers and anyone else who submits reports to the Crop and Livestock Reporting Service. Others need to subscribe by submitting a subscription form and fee. Obtain free subscriptions and/or subscription forms by writing:

State Statistician
